

Corn Sweet Argent - 86 days

Zea mays var rugosa

Argent is a white sweet corn with superb sweet, creamy flavor and excellent cultivation traits, including adaptability to cool soils, and high tolerance to Stewart's Wilt and Northern Corn Leaf Blight. Argent is a heterozygous sugary enhanced hybrid; it holds its sweetness and high quality flavor for days after picking.

When to sow outside: RECOMMENDED. 1 to 2 weeks after average last frost and when soil temperatures are warm (60 - 65°F).

Special sowing instructions: Easy to grow from seed. Since pollination occurs from wind, corn seed should be sown in short, parallel rows or blocks.

Harvesting: Corn is ready about 3 weeks after the silks appear; harvest when the silks are brown, but not dried, and the husks are dark green; ears should be plump. Pull back the husk and pop a kernel with your thumb; a milky juice squirting out means corn is ready. If juice is watery, corn is still immature.
